Introduction

This document describes the issue around local (non−domain) users not working properly with Tidal Enterprise Orchestrator (TEO) web services.

Prerequisites

Components Used

The information in this document is based on TEO 2.1 or later.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

Issue

SoapUI does not support NTLMv2. When authenticating non−domain accounts, the system will insist on using NTLMv1 and not revert to NTLMv2.

Possible Workarounds

The suggested workaround would be to use Basic Authentication for the web services if you must use a local user. If a local user is not a requirement, use a domain user. Digest authentication requires a domain account, and will not function properly with a local account. Refer to this information from Microsoft for more details.
