1.0 Introduction

IPv4 are depleting and IPv6 is future, but it would be like switch-off one and switch-on other. The internet world has to go through a transition, as IPv4 and IPv6 form their own inlands. In the period of transitions IPv4 and IPv6 have to talk to each other.

Multiple transition techniques are available like Dual-Staking, Tunneling. Which include: GRE (RFC 2473) 6to4 (RFC 3056), 6rd (RFC 5569), ISATAP (RFC 5214), MPLS 6PE, MPLS 6VPE (MPLS 6PE + VPN). Every technique has its own benefits and problems.

This document will demonstrator implementation of a transition technique, which enables IPv6-Only-Host, to communicate to IPv6-Internet as well as to IPv4-Internet. Communication to IPv6 is quite straight forward where for IPv4 it requires special implementation of NAT and DNS. For this experiment project we use GRE Tunnel (with Tunnel Broker) to advertise our IPv6 Prefixes. And use NAT64/DSN64 for dynamically map of IPv4 addresses to IPv6 for IPv6 Host and NAT IPv6 to IPv4 for IPv4 destination as defined in following IETF drafts:

- draft-ietf-behave-dns64-05
- draft-ietf-behave-v6v4-framework-06
- draft-ietf-behave-v6v4-xlate-09
- draft-ietf-behave-v6v4-xlate-stateful-08

NAT64 is also (Sort-off) part of NAT-PT. Conceptual layout of design show in figure 1.0:

Figure 1.1 Conceptual layout of NAT64/DNS64 deployment

- An IPv6 Prefix (Well-Known or Network prefix) is dedicated to map IPv4 prefixes.
 - We use 64:ff9b::/96 as recommended in draft-ietf-behave-dns64-05
- DNS64 convert A record into AAAA using NAT64 prefix, server A and AAAA record to clients
- Router connected to NAT64-Server, advertise NAT64 Prefix to attract traffic toward IPv4 servers.

2.0 Prerequisites

Before going into this you require:

- Account with IPv6 Tunnel Broker
- At least one (1) /48 IPv6 Global Aggregatable Unicast Prefix
- Internet Connectivity with static IP and /30 Live IPv4 prefix
- IPv6 enable Routers
- Linux Server
- Workstation IPv6 enabled OS

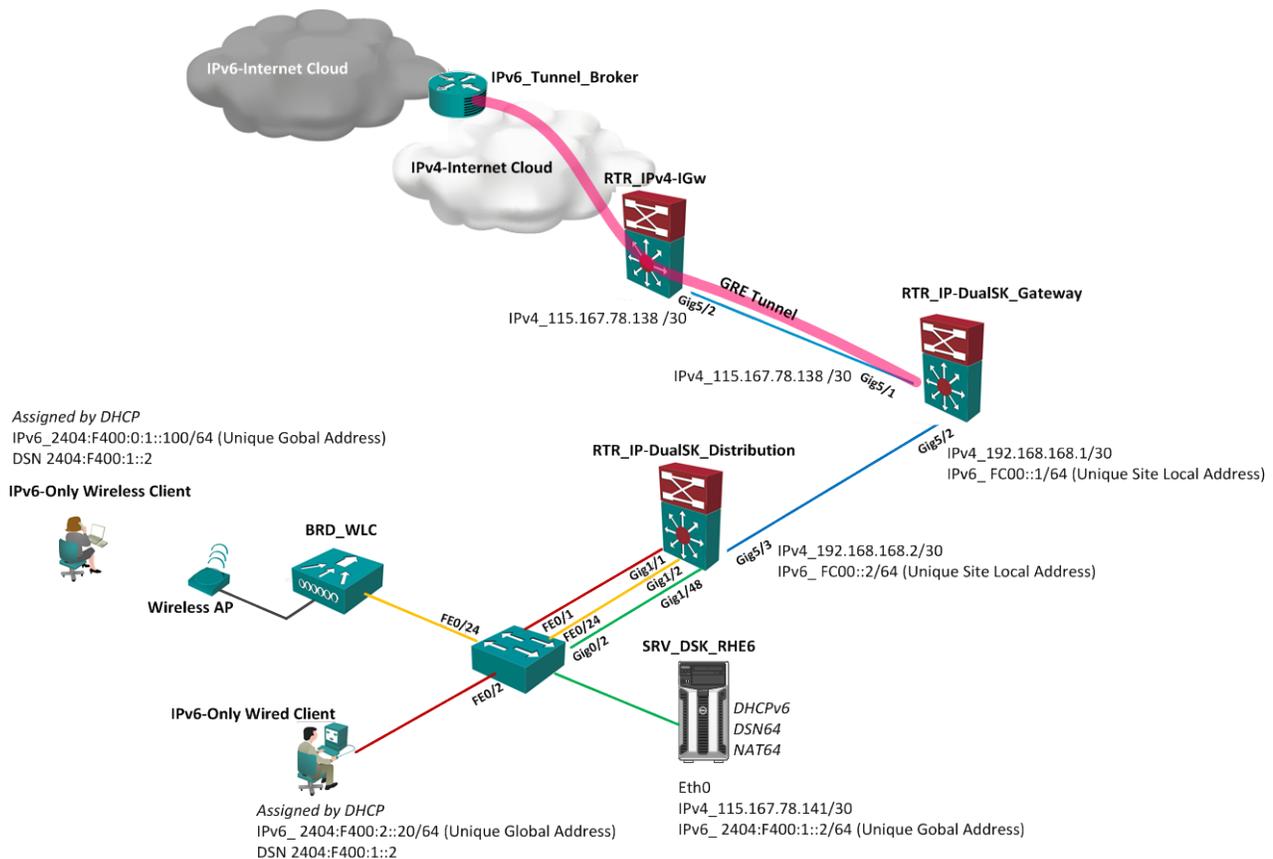

2.1 Component used

We have used following component to build lab:

- Account on “Hurricane Electric Free IPv6 Tunnel Broker”
- Three (3) /48 IPv6 Global Aggregatable Unicast Prefixes
- One (1) /30 IPv4 Prefixes
- Devices
 - Two(2) Cisco Routers
 - One (1) Desktop running Linux
 - Cisco Wireless Controller
 - One (1) Laptop with Win 7
- Ecdysis: open-source implementation of a NAT64 gateway

3.0 Network

This document uses this network setup:

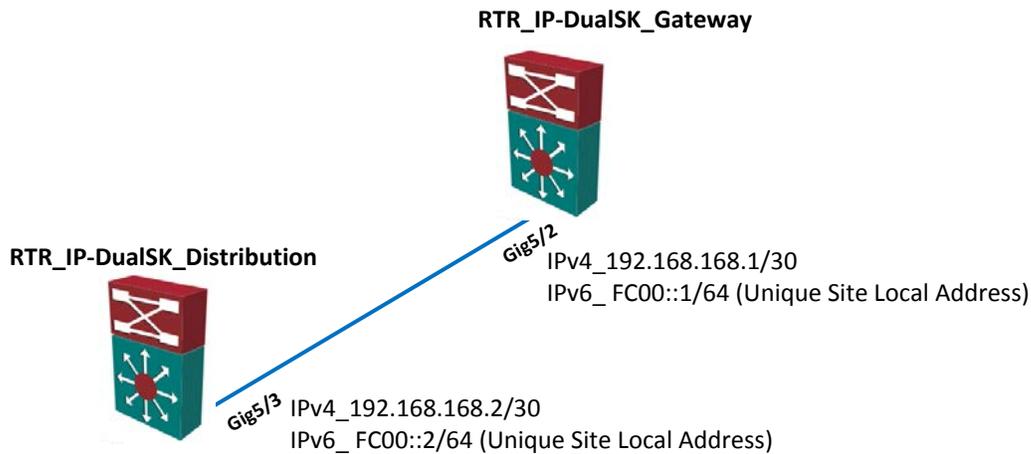

4.0 Configuration

This LAB was conducted in following Steps:

1. Lab Routers inter-connect
 - a. Establishing OSPFv3 and OSPFv2
2. IPv4 Internet Connectivity
3. GRE Tunnel to Tunnel Broker
 - a. BGP (address IPv6- Family)
4. IPv6 LAN and Wireless
 - a. Configure DHCPv6

- b. Configure DNSv6
 - c. Test browsing of IPv6 Sites (e.g www.google.com)
- Install Ecdysis: NAT64 gateway
5. Test IPv4 and IPv6 Internet Browsing

4.1 Lab Routers Inter-Connect

4.1.1 Verify

Use this section to confirm that your configuration works properly.

The **show ipv6 ospf database** and **show ip ospf database** command shows the Link State Database (LSDB) of the router for IPv6 and IPv4 respectively:

RTR_IP-DualSK_Distribution# **show ip ospf database**

4.2 IPv4 Internet Connectivity

RTR_IP-DualSK_Gateway Configuration

interface GigabitEthernet5/1	Configure IPv4 Address from IPv4 Internet Gateway
ip address 115.167.78.138 255.255.255.252	
end	
ip route 0.0.0.0 0.0.0.0 115.167.78.137	Point Default-Gateway route to ISP Router

4.2.1 Verify

Verify connectivity by checking reachability to any internet Destination

```
RTR_IP-DualSK_Gateway# ping 128. 223. 51. 103
```

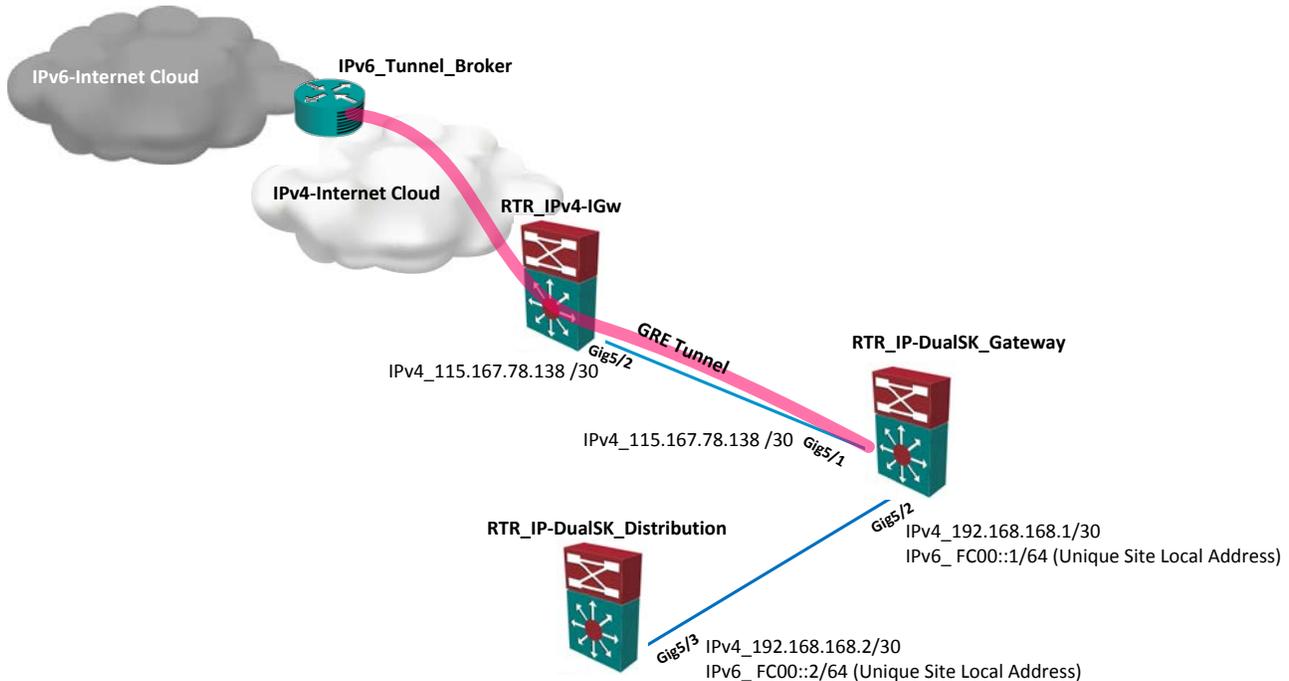

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 128.223.51.103, timeout is 2 seconds:

!!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 392/396/404 ms

4.3 GRE Tunnel to Tunnel Broker

RTR_IP-DualSK_Gateway Tunnel Configuration

```
interface Tunnel624
description Hurricane Electric IPv6 Tunnel Broker
no ip address
ip tcp adjust-mss 1460
ipv6 address 2001:470:14:ED::2/64
ipv6 enable
tunnel source 115.167.78.138
tunnel destination 216.66.84.50
tunnel mode ipv6ip
end
```

Configure GRE Tunnel to IPv6-Tunnel Broker, with IPv4 Source and Destination, and IPv6 address for Tunnel interface. Set the Tunnel Mode ipv6ip

```
ip route ::/0 Tunne624
```

Point Default-Gateway route for IPv6 networks towards Tunnel

4.3.1 Verify

```
RTR_IP-DualSK_Gateway#ping 2001: 470: 14: ED: : 1
```

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 2001:470:14:ED::1, timeout is 2 seconds:

!!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 164/164/168 ms

4.4 Multiprotocol BGP Configuration

RTR_IP-DualSK_Gateway BGP Configuration

<pre> ipv6 route 2400:F400::/32 Null0 ipv6 route 2404:F400::/48 Null0 ipv6 route 2404:F400:1::/48 Null0 ipv6 route 2404:F400:2::/48 Null0 </pre>	<p>Configure GRE Tunnel to IPv6-Tunnel Broker, with IPv4 Source and Destination , and IPv6 address for Tunnel interface.</p> <p>Set the Tunnel Mode ipv6ip</p>
<pre> ipv6 prefix-list IPv6 seq 1 permit 2400:F400::/32 ipv6 prefix-list IPv6 seq 2 permit 2400:F400::/48 ipv6 prefix-list IPv6 seq 3 permit 2400:F400:2::/48 ipv6 prefix-list IPv6 seq 4 permit 2400:F400:1::/48 </pre>	<p>Point Default-Gateway route for IPv6 networks towards Tunnel</p>
<pre> route-map IPv6-OUT permit 10 match ipv6 address prefix-list IPv6 </pre>	
<pre> router bgp 38547 no synchronization bgp log-neighbor-changes neighbor 2001:470:14:ED::1 remote-as 6939 neighbor 2001:470:14:ED::1 route-map IPv6-OUT out no auto-summary ! address-family ipv6 no synchronization network 2400:F400::/32 network 2404:F400::/48 network 2404:F400:1::/48 network 2404:F400:2::/48 neighbor 2001:470:14:ED::1 activate exit-address-family </pre>	

4.4.1 Verify

show bgp ipv6 unicast summary

This command provides output similar to the show ip bgp summary command, except it is IPv6-specific

```

RTR_IP-DualSK_Gateway#show ip bgp ipv6 unicast summary
BGP router identifier 172.16.16.1, local AS number 38547
BGP table version is 140385, main routing table version 140385
4771 network entries using 691795 bytes of memory
4771 path entries using 362596 bytes of memory
3524/3523 BGP path/bestpath attribute entries using 267824 bytes of memory
3423 BGP AS-PATH entries using 84156 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
BGP using 1406371 total bytes of memory
BGP activity 37975/33204 prefixes, 48534/43763 paths, scan interval 60 secs

Neighbor      V    AS MsgRcvd MsgSent   TblVer  InQ  OutQ  Up/Down  State/PfxRcd

```

4.6 Configure DHCPv6

DHCPv6 Configuration for Dual-Stack Server

```
[root@Srv_DualSK_RHE6 network-scripts]# vi /etc/dhcp/dhcpd.conf
```

```
default-lease-time 1800;

subnet6 2404:F400:0001::/64 {
}
subnet6 2404:F400:0002::/64 {
    range6 2404:F400:0002::10 2404:F400:0002::20;
    #Using DNS caching Server of Tunnel Broker
    option dhcp6.name-servers 2001:470:20::2;
}
subnet6 2404:F400:0000:1::/64 {
    range6 2404:F400:0000:1::10 2404:F400:0000:1::100;
    #Using DNS caching Server of Tunnel Broker
    option dhcp6.name-servers 2001:470:20::2;
}
:wq!
[root@Srv_DualSK_RHE6 network-scripts]# service dhcpd6 restart
Shutting down dhcpd (DHCPv6): [ OK ]
Starting dhcpd (DHCPv6): [ OK ]
```

Configure Dual-Stack Distribution's Interface for Wired LAN and Wireless LAN:

RTR_IP-DualSK_Distribution Interface Configuration (Datacenter Services)

interface GigabitEthernet1/1	Configure the Interface as IPv6-Only and Advertising the IPv6
description ** IPv6-SW-1 (FE0/2):(IPv6-LAN) **	Prefix in OSPFv3
no ip address	Setting to intimate the Host, to send DHCP request, in Router
ipv6 address 2404:F400:2::1/64	Advertisement (RA)
ipv6 enable	And also Acting as DHCP rely
ipv6 nd managed-config-flag	
ipv6 dhcp relay destination 2404:F400:1::2	
ipv6 ospf 69 area 0	
end	
interface GigabitEthernet1/2	Configure the Interface as IPv6-Only and Advertising the IPv6
description ** IPv6-SW-1 (FE0/24):(IPv6-Wifi) **	Prefix in OSPFv3
no ip address	Setting to intimate the Host, to send DHCP request, in Router
ipv6 address 2404:F400:0:1::1/64	Advertisement (RA)

```
ipv6 enable
ipv6 nd managed-config-flag
ipv6 dhcp relay destination 2404:F400:1::2
ipv6 ospf 69 area 0
end
```

And also Acting as DHCP relay

Now Connect your WIN7 Laptop to Switch, configured as Access port for Vlan 201

4.6.1 Verify

4.7 Build NAT64/DNS64

NAT64 implementation requires two components, DNS64 (for DNS synthesis) and IP-Translator which translator synthesized-IPv6 addresses to IP4 and put them on NAT.

Few implementations of NAT64 are available, like:

- **Open Source** :Ecdysis

- **Microsoft** : Forefront UAG DirectAccess
- **Cisco** : CGv6
- **Ericsson** : Field Trails

We have deployed Open Source : Ecdysis NAT64 Gateway. Ecdysis consist of two (2) separate package one is DNS package (bind and unbound) and second is NAT64 package.

We use Bind-implementation of DNS64, and install both NAT64 and DNS64 on same machine. Following are packages for Linux Redhat 6 Enterprise

Bind: Pre-patched full source: ecdysis-bind-9.7.2-P2D20101117.tar.gz

NAT64 - IP Translator: Source: ecdysis-nf-nat64-20101117.tar.gz

4.7.1 DNS64 Configuration

DNS64 Configuration for Srv_DualSK_RHE6

```
[root@Srv_DualSK_RHE6 esdsysis-bind-9.7.2-PSD20101117]# ./configure
[root@Srv_DualSK_RHE6 esdsysis-bind-9.7.2-PSD20101117]# make
[root@Srv_DualSK_RHE6 esdsysis-bind-9.7.2-PSD20101117]# make install
[root@Srv_DualSK_RHE6 esdsysis-bind-9.7.2-PSD20101117]# vi named.conf
```

```
//add dns option "dns64-prefix"
//The prefix must be a /96 or shorter.
dns64-prefix 64:ff9b::/96;
```

```
[root@Srv_DualSK_RHE6]# named -c named.conf
```

4.7.1.1 Verify

```
[root@Srv_DualSK_RHE6 ~]# dig @localhost www.yahoo.com aaaa

; <<>> DiG 9.7.2-P2 <<>> @localhost www.yahoo.com aaaa
; (1 server found)
;; global options: +cmd
;; Got answer:
;; ->>HEADER<<- opcode: QUERY, status: NOERROR, id: 31041

```

Now Again "dhcpd6.conf" replace

“option dhcp6.name-servers 2001:470:20::2;” → option dhcp6.name-servers 2404:F400:1::2;
And reconnect your laptop, perform uslookup and see the difference

DNS Query of IPv6 Enable Domain

C:\Users\Latherio>nslookup

Default Server: UnKnown

Address: 2404:f400:1::2

> www.google.com

Server: UnKnown

Address: 2404:f400:1::2

Non-authoritative answer:

Name: www.l.google.com

Addresses: 64:ff9b::d155:e768

Aliases: www.yahoo.com

fp.wg1.b.yahoo.com

note: you can see IPv6-synthesized answer in DNS reply(with NAT64 prefix)

4.7.2 NAT64 Configuration

NAT64 Configuration for Srv_DualSK_RHE6

```
[root@Srv_DualSK_RHE6 ecdysis-nf-nat64-20101117]# make
[root@Srv_DualSK_RHE6 ecdysis-nf-nat64-20101117]# make install
[root@Srv_DualSK_RHE6 ecdysis-nf-nat64-20101117]# vi ./nat64-config.sh
```

```
//IPv4_ADDR should your server IPv4 Address
```

```
//PREFIX_ADDR should be dns64-Prefix
```

```
IPV4_ADDR="115.167.78.142"
```

```
PREFIX_ADDR="64:ff9b::"
```

```
PREFIX_LEN="96";
```

```
[root@Srv_DualSK_RHE6]# ./nat64-config.sh
```

Route DNS64 Prefix towards Srv-DualSK_RHE6on Dual-Stack Distribution

```
Dual-Stack Distribution(config)#ipv6 route 64:FF9B::/96 2404:F400:1::2
```

4.7.2.1 Verify

C:\Users\Latherio>tracert ipv6.google.com

Tracing route to ipv6.l.google.com [2404:6800:8008::68]

over a maximum of 30 hops:

4.7.3 Traffic Flows

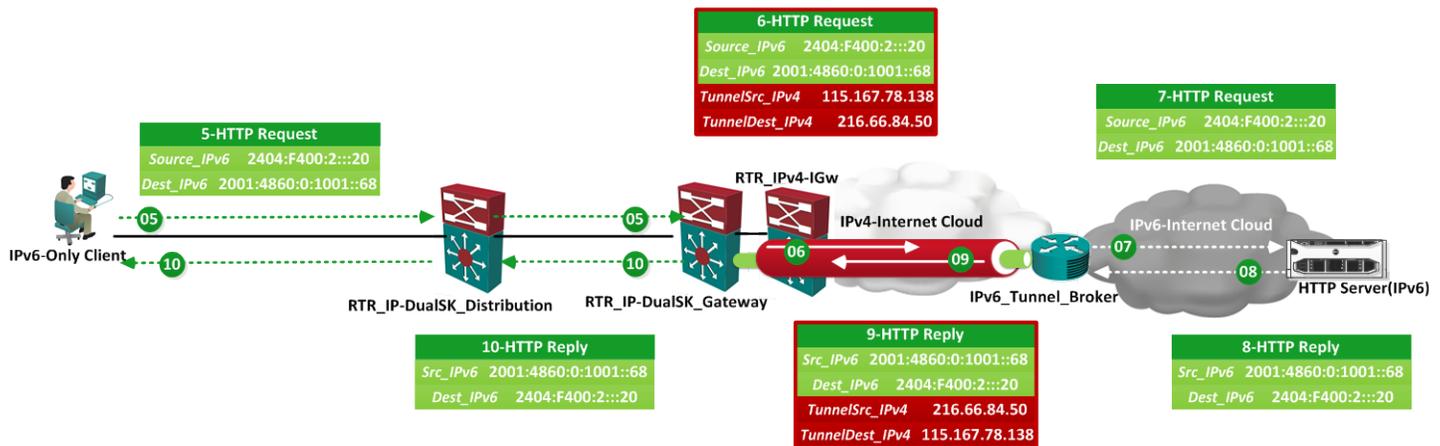

4.7.3.1 Browsing IPv6 Web Site

4.7.3.1.1 DNS Query IPv6 Enable Domain

1. IPv6-only Host request for AAAA record of ip6.google.com from primary configured DNS
2. Caching DNS (DNS64:Srv_DualSK_RHE6), reached the Google.com name Server, request AAAA record.
3. If the Authoritative have AAAA Record against the domain it will be return, which is true in this case. So, Google.com nameserver reply with IPv6 address for requested domain.
4. DNS (DNS64:Srv_DualSK_RHE6) pass-over the answer of google.com nameserver to the IPv6 Client in reply to his request.

4.7.3.1.2 Routing to IPv6 Site

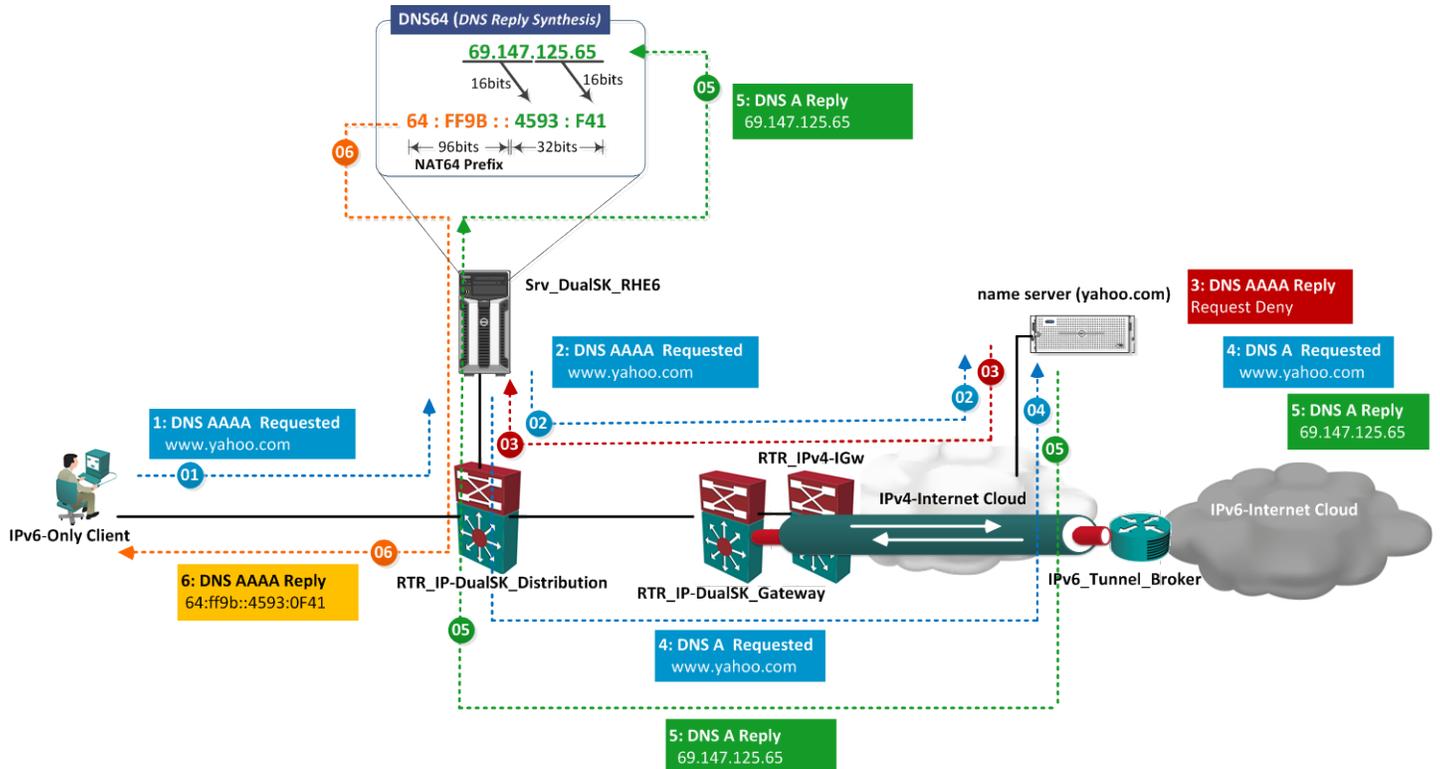

5. Client initial a HTTP request for the IPv6 , received by DNS in above process, packet with IPv6-Source and IPv6-Destination will take IPv6-Default-route to reach RTR_IP-DualSK_Gateway.
6. RTR_IP-DualSK_Gateway have IPv6-Default route pointed to GRE-Tunnel [**ip route ::/0 Tunn624**]; so it will encapsulate the IPv6 Packet to IPv4 Packet with its IPv4 as source and IPv6_Tunnel_Broker's IPv4 as destination, and forward it to RTR_IPv4-IGw. So, encapsulated packet reach IPv4 interface of IPv6_Tunnel_Broker Router via normal IPv4 internet routing.
7. IPv6_Tunnel_Broker will decapsulate the packet received for its interface IPv4 address, to extract IPv6 Packet, and route it to IPv6 internet. So, that it reach the IPv6 destination.
8. IPv6 destination prepares the reply for the IPv6 client, and hand-over to IPv6 routing. As IPv6_Tunnel_Broker is transit for Client's IPv6 prefix, reply for HTTP server reach the IPv6_Tunnel_Broker Router's IPv6 interface.
9. As IPv6_Tunnel_Broker Router have GRE-Tunnel as BGP next-hop for Client prefix , so it will encapsulate the IPv6 Packet to IPv4 Packet with its IPv4 as source and RTR_IP-DualSK_Gateway IPv4 as destination, and forward it to IPv4 internet cloud

for further routing . So, encapsulated packet reach IPv4 interface of RTR_IP-DualSK_Gateway Router via normal IPv4 internet routing.

10. RTR_IP-DualSK_Gateway will dencapsulate the packet received for its interface IPv4 address, to extract IPv6 Packet, and route in to IPv6 intranet. So, that it reach the IPv6 destination (the IPv6-Only Client).

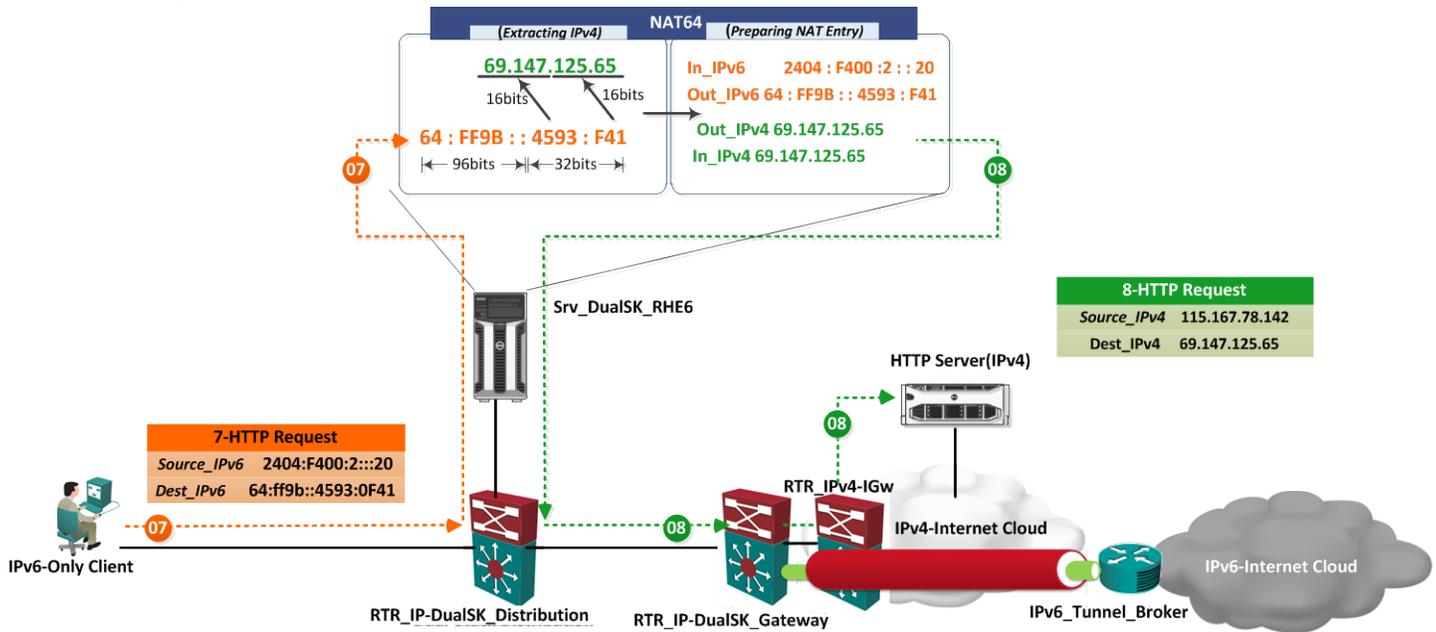

4.7.3.2 Browsing IPv4 Web Site

4.7.3.2.1 DNS Query non-IPv6 Domain

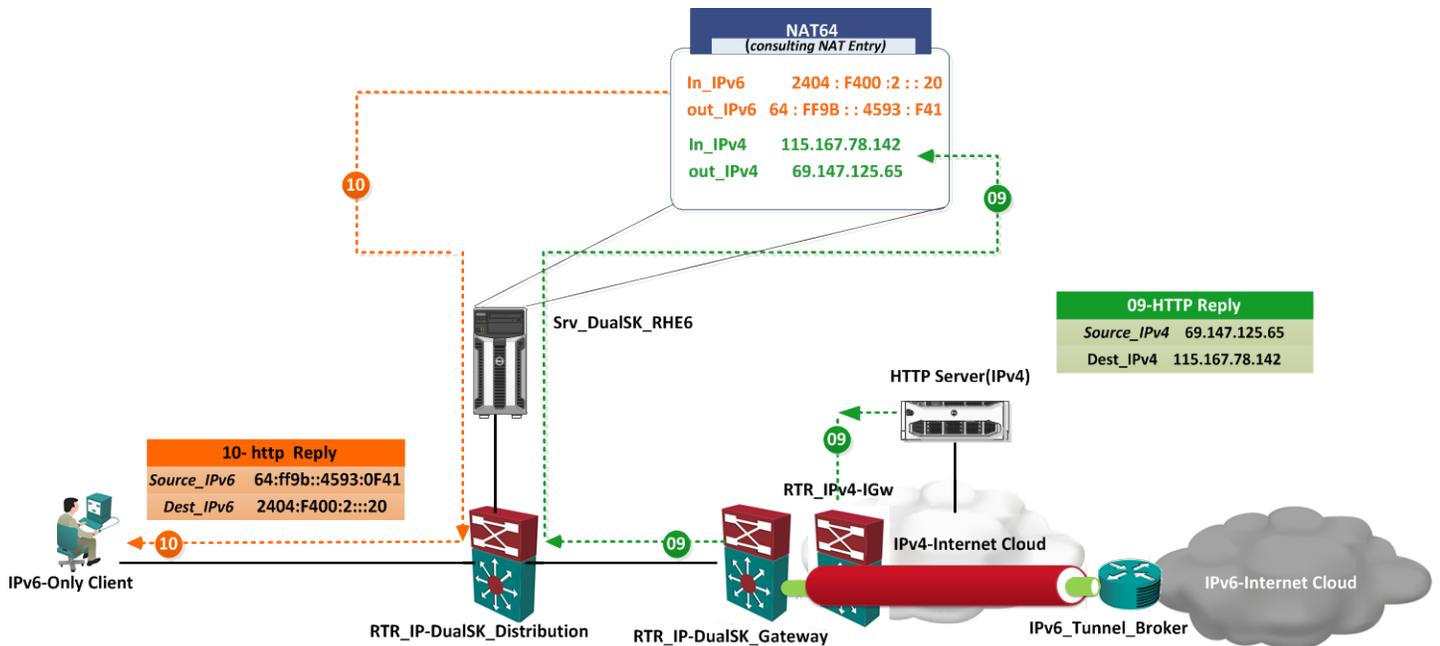

1. IP6-only Host request for AAAA record of www.yahoo.com form his primary configured local DNS Server.
2. Local DNS Server (DNS64:Srv_DualSK_RHE6), reached (via recursive query process) the yahoo.com name Server and request AAAA record.
3. If the Authoritative have AAAA Record against the domain it will be return, which is true in this false. So, yahoo.com nameserver reply no answer to the query.
4. Local DNS Server (DNS64:Srv_DualSK_RHE6), will not pass-over the answer to client, instead it query for A record.
5. Authoritative have A Record against the domain. So, yahoo.com nameserver reply with IPv4 address for requested domain.
 - a. Now DNS64 process triggered and it will synthesized a AAAA out of A reply from Authoritative nameserver, by appended NAT64 Prefix/96 (96 bits) to IPv4 (32 bits), build-up 128bits IPv6 Address
6. Then Local DNS Server (DNS64:Srv_DualSK_RHE6) pass-over the synthesized-AAAA answer for yahoo.com to the IPv6 Client in reply to his request.

4.7.3.2.2 Routing to IPv4 Site

7. After getting IP resolved by DNS server, it's time to generate HTTP Request with IPv6 Source and IPv6 Destination. Destination is NAT64 (64:ff9b::/96)Prefix, it not meant be routed to Default gateway by RTR_IP_DualSK_Distribution instead it has a Static route for the NAT64 Prefix [ipv6 route 64:FF9B::/96 2404:F400:1::2] point toward IPv6 Address of NAT64 Server. So RTR_IP_DualSK_Distribution route the packet to Srv_DualSK_RHE6.
 - a. NAT64 process running on Srv_DualSK_RHE6, accepted the packet, extract last-32bits, calculate IPv4 Address and forward the With its own IPv4 address , and create a NAT table entry of IPv6 Source, IPv4 Destination and TCP port.
8. Now Packet with IPv4-Source (Address of Srv_DualSK_RHE6) and IPv4-Destination (Address of www.yahoo.com), will reach to RTR_IP_DualSK_Gateway by following IPv4-Default-Route, which handed over to RTR_IPv4_IGw for further routing within IPv4-Could, So the IPv4 HTTP Server get the Packet with normal IPv4 inter-domain routing.

9. HTTP Server will prepare a reply distinct for NAT64 IPv4 address with Source of its IPv4 address. Normal IPv4 Routing mechanism will route the IPv4 packet to NAT64 server.
10. NAT64 process consult NAT entry and prepare repair IPv6 header for HTTP reply for IPv4 Server and Route it on IPv6 intranet to each IPv6-Only Client.
