### Related Information

---

## Introduction

This document shows how to configure a Network Address Translation Traversal (NAT–T) between Cisco VPN Clients located behind a Port Address Translation (PAT)/NAT device and a remote Cisco VPN Concentrator. NAT–T can be used between VPN Clients and a VPN Concentrator, or between concentrators behind a NAT/PAT device. NAT–T can also be used when connecting to a Cisco router running Cisco IOS® Software and PIX Firewall; however, these configurations are not discussed in this document.

## Prerequisites

### Requirements

There are no specific requirements for this document.

### Components Used

The information in this document is based on these software and hardware versions:

- Cisco VPN 3000 Concentrator 4.0(1)B
- Cisco VPN Clients: 3.6.1 and 4.0(3) Rel
- Cisco PIX Firewall (PAT device) version 6.3(3)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Network Diagram

This document uses this network setup:

There are VPN Clients on the two PCs (10.10.10.2 and 10.10.10.3) behind the PIX Firewall. The PIX in this scenario is simply being used as a PAT device, and conducts PAT on these addresses to 171.69.89.78. Any device that is able to PAT multiple internal connections can be used here. The VPN 3000 Concentrator public address is 172.16.172.50. The following example demonstrates how to configure the clients and the concentrator so that NAT-T is used during the IKE negotiation.

## Conventions

For more information on document conventions, refer to the Cisco Technical Tips Conventions.

## Background Information

After NAT-T negotiation is completed, the initiator can use any random User Datagram Protocol (UDP) port (Y). The destination port must be UDP 4500, as in UDP (Y, 4500), and the responder uses UDP (4500, Y). All subsequent Internet Key Exchange (IKE) negotiations and rekeying are done on these ports. During NAT-T negotiations, both the IPSec peers negotiate the UDP ports and also determine if they are behind a NAT/PAT device. The IPSec peer behind the NAT/PAT device sends the IPSec-over-UDP NAT keepalive packet to the IPSec peer that is not behind a NAT/PAT device. NAT-T encapsulates IPSec traffic in UDP datagrams, using port 4500, thereby providing NAT devices with port information. NAT-T autodetects any NAT devices, and only encapsulates IPSec traffic when necessary.

When implementing IPSec over NAT translation on the VPN 3000 Concentrator, IPSec over TCP takes first precedence, then NAT-T, and then IPSec over UDP. By default, NAT-T is turned off. You need to enable NAT-T using a checkbox located in NAT Transparency, under the IPSec configuration located under Tunneling Protocols. Also, for a LAN-to-LAN tunnel, you have to turn NAT-T on under the LAN-to-LAN configurations IPSec NAT-T field.

To use NAT-T, you must complete these steps:

1. Open port 4500 on any firewall you have configured in front of a VPN Concentrator.
2. Reconfigure previous IPSec/UDP configurations using port 4500 to a different port.
3. Choose **Configuration > Interfaces > Ethernet**, and choose the second or third options for the Fragmentation Policy parameter.

These options allow traffic to travel across NAT devices that do not support IP fragmentation; they do not impede the operation of NAT devices that do support IP fragmentation.

## Configure the PIX

The relevant configuration output for the PIX is shown here:

## PIX Firewall

```
pix501(config)#  
: Saved  
:  
PIX Version 6.3(3)  
nameif ethernet0 outside security0  
nameif ethernet1 inside security100

: end  
[ OK ]
```

## Configure the VPN 3000 Concentrator

This sample configuration assumes that the VPN 3000 Concentrator has already been configured for IP connectivity, and that standard (non–NAT–T) VPN connections have already been established.

To enable NAT–T on a VPN 3000 Concentrator release earlier than version 4.1, choose **Configurations > System > Tunneling protocols > IPSec > NAT Transparency**, then check the **IPSec over NAT–T** option on the concentrator as shown in the example below. The NAT–T option is off by default.

To enable NAT–T on a VPN Concentrator version 4.1 and later, navigate to the same NAT Transparency window by choosing **Configuration > Tunneling and Security > IPSec > NAT Transparency**.

## Configure the VPN Client

To use NAT-T, check **Enable Transparent Tunneling**. The following example demonstrates this on a VPN Client later than version 4.0.

**Note:** The same configuration option is available on VPN Client version 3.x.

## Verify

This section provides information you can use to confirm your configuration is working properly.

Certain **show** commands are supported by the Output Interpreter Tool ( registered customers only) , which allows you to view an analysis of **show** command output.

Additional troubleshooting information can be found at IP Security Troubleshooting – Understanding and Using debug Commands.

### Verify the PIX Configuration

These commands are used to verify the PIX configuration:

- **show xlate** As shown in the output below, the PIX is using different source ports for the two VPN Clients, but the destination ports are the same. All IPSec data packets are wrapped using UDP port 4500. Subsequent rekeying negotiations also use the same source and destination ports.

```
pix501(config)# show xlate
3 in use, 4 most used
PAT Global 171.69.89.78(1025) Local 10.10.10.3(4500)
PAT Global 171.69.89.78(1026) Local 10.10.10.2(4500)
PAT Global 171.69.89.78(4) Local 10.10.10.2(500)
```

- **show arp** Use this command to display the Address Resolution Protocol (ARP) table and determine if ARP requests are being processed.

```
pix501(config)# show arp
    outside 171.69.88.3 00d0.0132.e40a
    outside 171.69.88.2 00d0.0133.3c0a
    outside 171.69.88.1 0000.0c07.ac7b
    inside 10.10.10.3 0050.dabb.f093
```

```
inside 10.10.10.2 0001.0267.55cc
pix501(config)#
```

## VPN Client Statistics

Once the VPN tunnel is established, right-click on the yellow lock and choose **Status**. A similar window is shown below. Note that the tunnel port is UDP 4500, which proves that you are using NAT-T.

## VPN Concentrator Statistics

Complete these steps:

1. On the VPN Concentrator, choose **Administration > Administrator Session**.

The VPN Client session can be seen under Remote Access Sessions. The example below shows the sessions of the two clients after they have established an IPSec tunnel to the VPN Concentrator. They are both using the public IP address 171.69.89.78 and were assigned 40.1.1.1 and 40.1.1.2, respectively.

The screenshot shows the Cisco VPN 3000 Concentrator Series Manager interface. The left sidebar contains navigation links for IKE Proposals, NAT Transparency, SHP Routing, Management Protocols, Events, General, Client Update, Load Balancing, User Management (Base Group, Groups, Users), Policy Management, Administration (Administrator Sessions, Software Update, System Reboot, PING, Monitoring Refresh, Access Rights, IPsec Management, Certificate Management), and Monitoring (Routing Table, Filterable Event Log, Live Event Log, System Status, Sessions, Statistics). The main content area displays session statistics and session details.

**Session Summary**

Active LAN-to-LAN Sessions	Active Remote Access Sessions	Active Management Sessions	Total Active Sessions	Peak Concurrent Sessions	Concurrent Sessions Limit	Total Cumulative Sessions
0	2	1	3	4	100	52

**LAN-to-LAN Sessions**

Connection Name	IP Address	Protocol	Encryption	Login Time	Duration	Bytes Tx	Bytes Rx	Actions
No LAN-to-LAN Sessions								

**Remote Access Sessions**

Username	Assigned IP Address Public IP Address	Group	Protocol Encryption	Login Time Duration	Client Type Version	Bytes Tx	Bytes Rx	Actions
wncclient1	40.1.1.1 171.69.89.78	ciscoupa	IPSec/NAT-T 3DES-168	Oct 20 2013 35 0:04:04	WinNT 3.6.1 (Rel)	768	768	[Logout Ping]
wncclient2	40.1.1.2 171.69.89.78	ciscoupa	IPSec/NAT-T 3DES-168	Oct 20 2014 02 0:03:37	WinNT 3.6.2 (Rel)	512	512	[Logout Ping]

- Double-click on a client user name.

The IPSec/IKE statistics are shown, as seen in the example below. The UDP source port used by the client is 1029, and the destination port used is 4500.

The screenshot shows the Cisco VPN 3000 Concentrator Series Manager interface, similar to the previous one but focusing on specific session details. The left sidebar includes the same navigation links as the first screenshot.

**IKE Session**

Session ID 1	Encryption Algorithm	3DES-168
Hashing Algorithm	Diffie-Hellman Group	Group 2 (1024-bit)
Authentication Mode	IKE Negotiation Mode	Aggressive
Rekey Time Interval		86400 seconds

**IPSec/NAT-T Session**

Session ID 2	Remote Address	40.1.1.1
Local Address	Encryption Algorithm	3DES-168
Hashing Algorithm	Idle Time	0:00:11
Encapsulation Mode		Tunnel
UDP Source Port	UDP Destination Port	4500
Rekey Time Interval		28800 seconds
Bytes Received	Bytes Transmitted	256

**IPSec/NAT-T Session**

Session ID 3	Remote Address	40.1.1.1
Local Address	Encryption Algorithm	3DES-168
Hashing Algorithm	Idle Time	0:03:08
Encapsulation Mode		Tunnel
UDP Source Port	UDP Destination Port	4500
Rekey Time Interval		28800 seconds
Bytes Received	Bytes Transmitted	512

# Troubleshoot

This section provides information you can use to troubleshoot your configuration.

**Note:** Before issuing **debug** commands, refer to Important Information on Debug Commands.

**Note:** Additional PIX troubleshooting information can be found at IP Security Troubleshooting – Understanding and Using debug Commands.

## VPN Client Logs

On the PC on which the VPN Client is installed, open the Log Viewer before establishing a connection to the VPN Concentrator. This log output highlights the NAT-T-specific messages:

```

## Additional Troubleshooting

NAT-T encapsulates IPSec traffic in UDP datagrams using port 4500. If NAT-T is not checked on the VPN Concentrator or if NAT transparency is not checked on the VPN Client, the IPSec tunnel is established; however, you are not able to pass any data. For NAT-T to work, you must have the NAT-T checked on the concentrator and NAT transparency (over UDP) checked on the client.

The example below shows such a case in which NAT-T was not checked on the concentrator. On the client, Transparent Tunneling was checked. In this case, an IPSec tunnel is established between the client and the concentrator. However since the IPSec tunnel port negotiations failed, no data passes between the client and the concentrator. As such, the bytes transmitted and received are zero for the remote access sessions.

The screenshot shows the Cisco VPN 3000 Concentrator Series Manager interface. The left sidebar contains navigation links for various protocols, management, administration, monitoring, and system status. The main area displays session summary statistics and detailed session tables.

**Session Summary**

Active LAN-to-LAN Sessions	Active Remote Access Sessions	Active Management Sessions	Total Active Sessions	Peak Concurrent Sessions	Concurrent Sessions Limit	Total Cumulative Sessions
0	2	1	3	4	100	69

**LAN-to-LAN Sessions**

Connection Name	IP Address	Protocol	Encryption	Login Time	Duration	Bytes Tx	Bytes Rx	Actions
No LAN-to-LAN Sessions								

**Remote Access Sessions**

Username	Assigned IP Address Public IP Address	Group	Protocol	Login Time	Client Type Version	Bytes Tx	Bytes Rx	Actions
vpnclient2	40.1.1.1 171.69.89.78	ciscovpn	IPSec 3DES-168	Oct 20 20:57:15 0.02.11	WinNT 3.6.2 (Rel)	0	0	[Logout   Ping]
vpnclient1	40.1.1.2 171.69.89.78	ciscovpn	IPSec 3DES-168	Oct 20 20:58:38 0.00.48	WinNT 3.6.1 (Rel)	0	0	[Logout   Ping]

**Management Sessions**

Connection Name	IP Address	Protocol	Encryption	Login Time	Duration	Bytes Tx	Bytes Rx	Actions
[ LAN-to-LAN Sessions   Remote Access Sessions ]								

The example below shows the statistics of the VPN Client. Notice that the tunnel port negotiated is 0. There is an attempt to ping 192.168.2.251 (private interface of the VPN 3000 Concentrator) and 172.16.172.50 from a DOS prompt. However, these pings are failing because no tunnel port has been negotiated and, thus, the IPSec data is being discarded on the remote VPN server.

The screenshot shows a Windows command prompt window and a Cisco Systems VPN Client Connection Status dialog box.

**Command Prompt Output:**

```

D:\>ping 192.168.2.251
Pinging 192.168.2.251 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.2.251:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
  Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms

D:\>ping 172.16.172.50
Pinging 172.16.172.50 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 172.16.172.50:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
  Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
  
```

**Cisco Systems VPN Client Connection Status Dialog:**

Cisco Systems VPN Client Connection Status	
<a href="#">General</a>   <a href="#">Statistics</a>	
Connection Entity:	cisco2
Client IP address:	40.1.1.2
Server IP address:	172.16.172.50
Encryption:	168 bit 3DES
Authentication:	HMAC MD5
Transparent Tunneling:	Inactive
Tunnel Port:	0
Compression:	None
Local LAN access:	Disabled
Personal Firewall:	None
Firewall Policy:	None

Note: Stateful Firewall (Always On) status is not represented above. To view this status, right click on the system tray icon. If checked, this functionality is enabled.

Time connected: 00:06:42

Buttons: OK, Notifications..., Play!, Disconnect

The example below shows that the VPN Client is sending encrypted data (13 packets). But the number of decrypted packets is zero for the remote VPN server, and it has not sent any encrypted data back. Since no tunnel port has been negotiated, the remote VPN server discards the packets and sends no reply data.
