

Public Address 216.x.x.1 NAT'd to 192.168.0.2
Route to 192.168.0.0 via 10.255.255.2

I can see on the Sonicwall log that traffic from 216.x.x.1 is NAT'd to 192.168.0.2 inbound on interface X1 and forwarded via X2 as 192.168.0.2, which is correct.

No natting on Sonicwall, only forwards

The Sonicwall can ping 172.31.0.2

If I put a laptop at address 172.31.0.3 and GW of 172.31.0.2 I can ping 192.168.0.2 without any problems

I cannot get traffic from the Internet to get to 192.168.0.2
